Comparison of the sequence of HPV33 and HPV 52 revealed 75% homology in the L1ORF and less than 50% homology in the noncoding region. The HPV 52 was isolated and cloned from the combined DNA of biopsies of 2 mild dysplasias. The DNA was cloned into lambda L47 and positive plaques by nonstringent hybridisation with HPV-16 probes were isolated to obtain HPV 52 DNA. The probes obtained from this sequence can be used for detecting HPV infection in a sample, for assessing the risk of cancer development, in partic. for detecting HPV 52 which may play a role in cervical cancer development. The HPV 52 anti-sense RNA or relargments can be used as blockers or regulators of HPV gene expression in general and HPV 52 in partic. (Updated on 25-MAR-2003 to correct PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human papilloma-virus type 52 DNA and RNA - used in probes for detecting HPV infection in samples and for blocking HPV gene expression.
                                                                                    The L1 gene (AAT40119) codes for the major capsid protein (AAW05843) of human papillomavirus type 18 (HPV18), an HPV type associated with invasive carcinomas of the cervix, vagina, vulva and anal canal. The DNA sequence was deduced from a genomic clone isolated from human cervical carcinoma-derived SW756 cells using an HPV18 L1 probe. The HPV18 L1 and L2 (see also AAT40120) genes can be used in vaccines against HPV18 infection, as probes, or to produce recombinant capsid proteins in host
and related vectors and antibodies, useful in protective vaccines, for serotyping HPV infections and as therapeutic agents.

New composition having a nucleic acid molecule identical to genomic clone of human papilloma virus 16, 18 or 51, useful in diagnosing cancer or the risk of developing cancer, in particular cervical, anal, colon and HPV-related cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of developing cancer, in particular cervical, anal, colon and HPV-related cancer. The present DNA sequence represents a human papilloma virus full length genomic clone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises a composition for the detection of cancer markers, the composition contains a nucleic acid molecule which is substantially identical to a full length genomic clone of a human papilloma virus (type 11, 16, 18, 51, 56, 58, 66, 70, or 73). The composition of the invention is useful for diagnosing cancer or the
Human papillomavirus type 58 full length genomic clone - SEQ ID

ö
The present invention relates to a human cell line, which lacks major histocompatibility class I (MHC-I) and MHC-II antigens and which has been modified to comprise and express a gene encoding an immunomodulator and a gene encoding an antigen of Epstein-Barr virus (EBV). The human cell line, compositions and methods are useful for inducing or stimulating an immune response in a human to an EBV-associated cancer, where the human has or is at risk for Hodgkin's lymphoma, T-cell lymphoma, B-cell lymphoma, parctic carcinoma, Burkitt's lymphoma, T-cell lymphoma, B-cell lymphoma, sequence represents a nucleotide sequence associated with the cell line
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a human cell line, which lacks major histocompatibility class I(MHC-I) and MHC-II antigens and which has been modified to comprise and express a gene encoding an immunomodulator and a gene encoding an antigen of Epstein-Barr virus (EBV). The human cell line, compositions and methods are useful for inducing or stimulating an immune response in a human to an EBV-associated cancer, where the human has or is at risk for Hodgkin's lymphoma, nasopharyageal carcinoma, gastric carcinoma, burkitt's lymphoma, T-cell lymphoma, B-cell lymphoma, parotid carcinoma, breast carcinoma, and leiomyosarcoma. The present sequence represents a nucleotide sequence associated with the cell line
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 major histocompatibility class I; MHC-I; MHC-II; Cytostatic; EBV-associated cancer; Hodgkin's lymphoma; nasopharyngeal carcinoma; gastric carcinoma; Burkitt's lymphoma; T-cell lymphoma; B-cell lymphoma; parotid carcinoma; breast carcinoma; leiomyosarcoma; ds.

The encoding DNA, which is contained in pV2201-1 (DSM 10097), is useful for the diagnosis of HPV disease, especially skin cancer, and for the preparation of the protein. The protein is useful for the diagnosis,

The invention relates to a novel method for producing papillomavirus virus-like particles or capsomeres comprising providing a transgenic plant or plant seed transformed with a nucleic acid molecule comprising papillomavirus il capsid protein coling sequences and growing the transgenic plant or transgenic plant grown from the transgenic plant seed under conditions effective to produce the virus-like particles containing the papillomavirus il capsid protein. The invention may have virucide applications whilst the methods, genetic construct and plant may be unseful for immunising a subject against a disease resulting from infection by a papillomavirus, as well as during gene therapy procedures. The current sequence is that of the plant-optimised NLS (nuclear localisation signal)-deleted Human papillomavirus type 16 (HPV16) L1 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Producing papillomavirus virus-like particles or capsomeres comprises providing a transgenic plant or plant seed transformed with a nucleic acid molecule comprising a papillomavirus L1 capsid protein coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Site_2: Not1; This BB17 cDNA library was generated by subtraction of the BB16 library with 4000 previously sequenced clones. The BB16 library was contributed by the Soares laboratory and it was constructed and normalized as described by Bonaldo, M.F., Lennon, G. and Soares, M.B. (1996), Genome Research 6(9): 791-806 RNA was prepared from dissected brains of adult worker bees of various ages and various behavioral groups."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 9, Application US/09628099
Patent No. 636832
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Shamanin, Vladimir
APPLICANT: De Villiers-Zur Hausen, Ethel-Michele
APPLICANT: Zur Hausen, Harald
TITLE OF INVENTION: PAPILLOWA VIRUSES, AGENTS FOR DETECTING
TITLE OF INVENTION: THEM AND FOR TREATING DISEASES CAUSED BY SUCH VIRUSES
FILE REFERENCE: 8484-0037-999
CURRENT APPLICATION NUMBER: US/09/628,099
CURRENT FILING DATE: 2000-05-26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                        Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 6, A

The invention relates to a general primer or primer pair for amplifying and detecting or for use in a nucleic acid amplification process for amplifying Human Papillomavirus (HPP) genotypes. The general primers are useful for amplifying cervical-neoplasia related HPV genotypes including

The activity of nucleotide sequences of the invention may be described as virucidal and immunostimulantary. The isolated nucleotide sequence is useful in a method of producing a papillomavirus protein. The papillomavirus protein encoded by the nucleotide sequence is useful in the manifacture of a pharmaccutical composition for prophylactic treatment of cervical lesions and carcinomas caused by papillomavirus. Polynucleotides of the invention may be useful in vaccines or in gene therapy. The current sequence represents the HPV 16 Ll capsid protein gene SA-Ll-NLS (South African isolate)
oncogenic high-risk groups and low-risk groups. The general primers are useful for producing amplifying products to DNA of scores of diverse oncogenic HPV types and thus detecting the oncogenic HPV types in a sample but also to select cervical carcinoms and its pre-stage lesions at early stage by improving sensitivity according to HPV types. This sequence corresponds to PCR primer used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleotide sequence encoding papillomavirus protein, useful in the manufacture of a pharmaceutical composition for preventing cervical

papillomavirus sequence, encoding the L1 capsid protein. The activity of nucleotide sequences of the invention may be described as virucidal and immunostimulantary. The isolated nucleotide sequence is useful in a method of producing a papillomavirus protein. The papillomavirus protein encoded by the nucleotide sequence is useful in the manufacture of a pharmaceutical composition for prophylactic treatment of cervical lesions and carcinomas caused by papillomavirus. Polynucleotides of the invention may be useful in vaccines or in gene therapy. The current sequence. represents the HPV 16 L1 capsid protein gene SAopt-L1-NLS (Optimised
                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleotide sequence encoding papillomavirus protein, useful in the manufacture of a pharmaceutical composition for preventing cervical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention relates to a new isolated nucleotide sequence containing

The patent discloses a chimeric protein comprising papillomavirus L1 or L2 protein and a biotin-binding polypeptide. Capsomere, papillomavirus or virus-like particle (VLP) comprising the chimeric protein is used for delivering a wide variety of biotinylated compounds e.g. proteins. Calls. The chimeric protein may also be used as a vaccine when the biotinylated substance is a viral antigon e.g. papillomavirus E2 or E7 proteins. It may be useful for treating tumours or other papillomavirus. Crelated lesions when the substance is a cytotoxin, chemocherapeutic agent, radioactive agent, or a gene encoding a cytokine or interleukin. The present sequence is a DNA encoding a chimeric protein 168 consisting of human papillomavirus 16 (HPV-16) mutant L1 protein fused to a biotinbinding peptide at the Cterminus. The L1 protein fused to a biotinbinding peptide at the Cterminus. The L1 protein fused from the wild-type sequence by deleting the amino acid Cys428. The modification of was done to prevent assembly of VLPs while allowing the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric biotin-binding human papillomavirus mutant L1 protein-169 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This nucleotide probe is specific for the HPV16 Human Papilloma Virus (HPV) gene. The degree of HPV infection can be assessed, by measuring the levels of expression of genes involved in the diseased state, and comparing the expression to each other or to reference genes. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chimeric biotin-binding human papillomavirus mutant L1 protein-168 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gapa

The sequences given in AAQ47166-67 encode the L1 capsid proteins from bovine and human papillomavirus respectively. These sequences may be inserted into a baculovirus transfer vector and operatively expressed by a promoter of the vector, and the capsid protein produced by transformed cells. The capsid protiens may be used in vaccines to induce high-titre neutralising antibody response in vertebrates. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The patent discloses a chimeric protein comprising papillomavirus il or il protein and a biotin-binding polypeptide. Capsomere, papillomavirus or virus-like particle (VLP) comprising the chimeric protein is used for delivering a wide variety of biotinylated compounds e.g. proteins a used for cells. The chimeric protein may also be used as a vaccine when the chimeric protein may also be used as a vaccine when the conjointylated substance is a viral antigen e.g. papillomavirus E2 or F2 proteins. It may be useful for treating tumours or other papillomavirus. C agent, radioactive agent, or a gene encoding a cytokine or interleukin. The present sequence is a DNA encoding a cytokine or interleukin. The present sequence is a DNA encoding a cytokine or interleukin. The present sequence is a DNA encoding a cytokine or interleukin. The present sequence is a DNA encoding a cytokine or interleukin. The present sequence is a DNA encoding a cytokine or interleukin. The present sequence is a DNA encoding a cytokine or interleukin. The present sequence by deleting the amino acid Cys428. The modification of was done to prevent assembly of VLPs while allowing the production of

Papillomavirus strain 16 (HPV16). This recombinant form of viral protein is capable of self-assembly into capsomer structures and viral capsids that comprise conformational antigenic epitopes can be used as a vaccine for the prevention or treatment of papillomavirus infections in vertebrates. The vaccine comprises a unit dose of a composition containing a self assembled HPV16 with at least 1 papillomavirus L1 conformational epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Capsid protein; 11; HPV16; vaccine; prevention; treatment; self-assembly; viral protein; capsomer; capsid; antigenic epitope; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence encodes the Li capsid protein from Human Papillomavirus strain 16 (HPV16). A recombinant form of this viral protein which is capable of self-assembly into capsomer structures and viral capsids that comprise conformational antigenic epitopes can be used as a vaccine for the prevention or treatment of papillomavirus infections in vertebrates. The vaccine comprises a unit dose of a composition containing a self assembled HPV16 with at least 1 papillomavirus Li conformational epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccine against human papilloma virus - comprises HPV16 L1 polypeptide.

                                                                                                                                                               The sequences given in AAQ47166-67 encode the L1 capsid proteins from bovine and human papillomavirus respectively. These sequences may be inserted into a baculovirus transfer vector and operatively expressed by a promoter of the vector, and the capsid protein produced by transformed eells. The capsid protiens may be used in vaccines to induce high-ritre neutralising antibody response in vertebrates. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. RESULT 12 AAV25817/ 10-JUL-1998 (first entry)

AAV25817;

```
The present sequence represents the human papillomavirus proto-type HPV

16 L1 genome 5637-7155, from the present invention. The present invention

26 describes the immunisation of a host mammal against a papillomavirus

27 comprising administering to the host, according to an immunising

28 schedule, a self-assembled Human Papilloma Virus (HPV16) capsid (I)

29 containing at least 1 papillomavirus L1 conformational epitopes are produced by letting a

20 genetic construct comprising a papillomavirus L1 gene direct recombinant

21 cell by self-assembly of papillomavirus capsids containing a L1

22 polypeptide having an amino acid sequence encoded by the nucleic acid

23 polypeptide having an amino acid sequence encoded by the nucleic acid

24 polypeptide paving an amino acid sequence encoded by the nucleic acid

25 polyment of papillomavirus capsids containing a L1

26 polypeptide paving an amino acid sequence encoded by the nucleic acid

27 sequence given in the specification (see AAV25817). (I) are useful for

28 the diagnosis of and as vaccines for the prevention of papillomavirus

29 infections and their benign and malignant sequelae in vertebrates.

29 cused to produce remewable papillomavirus previence of any selected species

20 and type in cell culture. The self-assembled recombinant L1 capsid

20 protein has the efficacy of intext papillomavirus particles to induce

20 high levels of neutralising antiserum, in contrast to prior art L1

20 protein extracted from recombinant bacteria or denatured virions

The present sequence encodes the human papillomavirus HPV 16 Li
conformational epitope, from the present invention. The present invention
describes the immunisation of a host mammal against a papillomavirus
comprising administering to the host, according to an immunising
schedule, a self-assembled Human Papilloma Virus (HPV16) capsid (I)
containing at least 1 papillomavirus Li conformational epitope. The
papillomavirus Li conformational epitopes are produced by letting a
genetic construct comprising a papillomavirus Li gene direct recombinant
expression of the conformational epitope in a transformed eukaryotic host
expression of the conformational epitope in a transformed eukaryotic host
copypapitde having an amino acid sequence encoded by the nucleic acid
sequence given in the specification (present sequence). (I) are useful
for the diagnosis of and as vaccines for the prevention of papillomavirus
infections and their benign and malignant sequence of any selected species
used to produce renewable papillomavirus proteins are provided which can be
used to produce renewable papillomavirus reagents of any selected species
and type in cell culture. The self-assembled recombinant Li cappid
protein has the efficacy of intact papillomavirus particles to induce
thigh levels of neutralising antiserum, in contrast to prior art Li
protein extracted from recombinant bacteria or denatured virions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunisation of mammals and humans against papillomavirus infection comprises administering recombinant self-assembled capsid proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    containing conformational epitopes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; Col 21-24; 20pp; English.

The method comprises contacting the sample with an antibody and detecting any antibody binding. The antibody is a polyclonal or monoclonal antibody produced by transforming a eukaryotic host cell with a genetic construct containing a papillomavirus L1 gene so that the cell expresses self-assembled papillomavirus-like particles containing at least 1 papillomavirus L1 conformational epitope. The present sequence encodes wild-type human papillomavirus L1 polypeptide. The method is for

An method has been developed for detecting papilloma virus in a specimen from a mammal. The method comprises contacting the sample with an antibody and detecting any antibody binding. The antibody is a polyclonal or monoclonal antibody produced by transforming a eukaryotic host cell with a genetic construct containing a papillomavirus Li gene so that the cell expresses self-assembled papillomavirus-like particles containing at least I papillomavirus Li conformational epitope. The present sequence encodes protocype human papillomavirus Li polypeptide. The method is for the diagnosis of papillomavirus infections in mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This sequence encodes the human papillomavirus 16 (HPV16) L1 gene protein. The protein can be used in the method of the invention for detecting antibodies to a papilloma virus in a sample from a mammal. The method comprises: (a) providing self-assembled papillomavirus-like particles comprises at least one L1 conformational applilomavirus. The particles comprise at least one L1 conformational applitomavirus L1 gene to direct recombinant expression in a transformed eukaryotic host cell; (b) contacting the sample with the self-assembled papillomavirus-like particles; and (c) detecting any antibody binding to the self-assembled papillomavirus-like particles and c) detecting any entibod and the self-assembled for detecting antibodates to HPV16 as an indication of infection. (Updated on 17-OCT-2003 to standardise OS field)

//note="Vector: pluescript II SK(+) XR; Site 1: EcoRI;
//note="Vector: pupplier: Developmental series" Plants from pathogen-free Solanum tuberosoum var. Shepody, clone 176, nuclear stock were grown in a screenhouse under natural conditions. Developing floral buds were harvested at various sizes up to opening and pooled. RNA was isolated and used for library construction. A normalized library was constructed following a modified protocol of Bonaldo et al. (1996. Genome Research 6: 791-806)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CV504457 613 bp mRNA linear EST 04-OCT-2004 71003.1 Mixed Floral Solanum tuberosum cDNA clone 71003 5', mRNA sequence.
